

The radiant reflective signature of ice breakup and the natural atmospheric attenuation of microwave radiation

Just wanted to forward you some interesting material about the effect of emf and the effects that they may have on ice sheets, ie global warming.

The radiant reflective signature of ice breakup and the natural atmospheric attenuation of microwave radiation

In nature it has been found using reflective technologies that certain natural formations give off certain characteristic signatures. Of these recently there has been investigations of polar ice sheets. It has been observed that the polar ice has different refractive signatures. That is that new ice which is intact and not breaking up radiates back in the 100-300 hertz range. On the other hand old ice or ice which is breaking up tends to reflect back a signature in the 500-800 hertz range. It is entirely possible that given the relative absorbant range that ice, either polar or glacial would tend to react to background radiation with a commensurate breakup in the ice if exposed to increased levels of radiation in the ranges that simulate ice breakup. Though not proven this relationship is extremely important to investigate in relationship to the rapid meltdown of continental and polar ice formations.

Additionally during severe storms, usually on the upper surface where the ice or snow often starts, the ice tends to naturally scatter microwave radiation and at the same time spends itself in increased rainfall. It has been noted that the particular range of emanation of the upper stratosphere ice withing systems is in the range of 85 giga hertz which could be used to amplify the natural effect of a natural storm system to counter increase emf radiation. The application or mimicry of natural systems might have more create more practical approaches to the so called problems of global warming which are in part emf engendered. Also the preservation of natural systems would go a long way towards retarding the loss of natural aquifer systems, upon which hundreds of millions of individuals are dependent. The systems are the same irregardless of the continents that they are on.
