

The Cell Phone Cancer Question, Again

By [Kiera Butler](#) | Wed July 1, 2009 3:30 PM PST

The debate over [whether electromagnetic radiation from cell phones and other wireless technology causes cancer](#) rages on. Yesterday, an advocacy group called the National Institute for Science, Law, and Public Policy [<http://www.swankin-turner.com/nislapp.html>] sent a [letter](#) to journalists and lawmakers urging them to "learn about the health consequences of microwave radiation exposure from cell phones, neighborhood antennas, wireless networks, wireless routers, DECT portable phones, and the potential health consequences of further chronic exposures from wireless broadband and new wireless utility technologies."

The folks behind this latest media blitz are some of the same ones who authored the controversial [BioInitiative Report](#) in 2007, which linked wireless radiation to cancer and a host of other health problems. When I investigated the issue of whether cell phones cause brain cancer last spring, I was told by some *BioInitiative* authors that we'd finally have the answer in a few months, when the conclusive results from the multinational [Interphone Study](#), the holy grail of cell phone health research, would finally be released.

But a year later, the results still haven't been released. Why not?
